

Hallez.—The influence of high altitudes on the general nutrition: H. **Guillemand** and R. **Moog**. The observations were carried out at Paris, at the Grand Mulets (3050 metres), and the summit of Mt. Blanc (4810 metres), the changes in the urine being more specially examined. It was found that the effect of high altitudes on nutrition was to produce a diminution of the oxidation processes, diminution of diuresis, and retention of the fixed elements.—The spleen and the biliary secretion: N. C. **Paulesco**. Experiments on dogs leads to the conclusion that the spleen exercises no apparent influence on the formation of bile.—Researches on the formation of haemoglobin in the embryo: L. **Hugouneng** and Albert **Morel**.—The aurora borealis of November 15 and the magnetic disturbances of November 12 and 15: Th. **Moureaux**. The appearance of the aurora corresponded to strong magnetic disturbances.—Observations on atmospheric electricity in Grahamsland: J. **Rey**.
