quire watching.-J. Deprat: The modifications in the structure of the Fusulinidæ from the Dinantian to the end of the Permian.—Pereira de Sousa: The earth-quakes at Algarve (southern Portugal) from 1911 to 1914. These appear to be of epirogenic origin.—B. Galitzine: The earthquake of February 18, 1911. This earthquake coincided with a great rock slide at Sarez, in the Pamir, which filled up the valley of Mourgab and transformed it into a lake. The author concludes that this rock fall was not the consequence, but the cause of, the seismic disturbance registered at so many stations.—J. Clarens: The estimation of urinary acidity.—H. Busquet: The mode of action of colloidal gold: the production of cardiac effects by particles of metal not in solution. From a study of the effects of the injection of colloidal gold into the dog and rabbit, it is concluded that the immediate effects on the heart cannot be attributed to gold in solution, but must be produced by the suspended colloidal particles.—H. Stassano: The sterilisation of microbial cultures or emulsions by heat in thin layers.-Em. Bourquelot, M. Bridel, and A. Aubry: Researches on the glucosidification of glycerol by β -glucosidose (emulsin). The product obtained by the biochemical synthesis contained two glucosides, differing in their rotatory power and resistance to the action of emulsine.
