

► There is general agreement that complex databases should not simply be made freely available, as their proper exploitation requires an understanding of how the data have been assembled, and the various caveats they contain. But many scientists say that analogous problems in other areas — such as census data — are overcome by employing individuals to provide such assistance. The CVL would need an extra dozen people to do this, says one MAFF scientist. “It would take a lot of resources, but I think it would be well worth doing.”

Indeed, MAFF's failure to assign sufficient staff to the analysis and distribution of BSE data appears to have been a major factor contributing to the difficulties faced by outside scientists. Graham Medley, a biostatistician at the University of Warwick, says he has benefited from greater cooperation from MAFF after having complained on a television programme about the prob-

lems of gaining access to MAFF data. Since then he has encountered few such difficulties, and attributes any that have arisen simply to the fact that the CVL is “inundated” with requests, and is “grossly understaffed”.

Statistical research on the BSE epidemic within MAFF has been left mainly to a handful of researchers at the CVL. The small numbers of people involved is “staggering for a problem of this importance”, says one scientist. Anderson says that, given the scale of the BSE problem, MAFF should have quickly assembled “a large and effective team collaborating with external teams with expertise in particular areas”, and that this should have included researchers from other European countries.

Moreover, Anderson argues that cut-backs in government science over the past decade have made such external input more important than ever. These cuts have reduced the government's capacity to carry out the in-house research required to deal with complex scientific issues in many areas, he says. What is now needed, argues Anderson, is an interministerial body — perhaps organized by the Office of Science and Technology — that would assess important scientific issues, decide whether outside expertise was needed, and, if so, arrange for it to be brought in quickly. **Declan Butler**

## New Zealand scientists seek to revive political fortunes

Sydney. Spending on research by the government of New Zealand has recently begun a slow upturn after a lengthy period of decline. But the scientific and academic communities are still seeking the support of the political parties taking part in the general election on 12 October for further improvements to funding, especially for universities.

Scientists continue to express concern at the effects on research and university teaching of the cost-cutting and restructuring that accompanied the rapid shift towards ‘user pays’ and ‘privatization’ or ‘corporatization’ of public services over the past few years. These policies were introduced by a Labour government and extended by their National Party successors.

But the scientists' campaign is clouded by a new and unpredictable electoral system. Twenty-seven parties are vying for 120 seats under a ‘mixed-member proportional’ system that has replaced the traditional first-past-the-post method of electing 99 members to the single-chamber parliament.

The New Zealand Association of Scientists (NZAS) and the Royal Society of New Zealand have lobbied for public funding to be restored to the levels that applied when the cuts began 15 years ago. New Zealand spent 1.03 per cent of its gross domestic product on research and development (R&D) in 1993, placing it fourth from the bottom out of 24 leading economies. Private-sector spending on R&D is even lower on this list.

Since 1989, responsibility for policy advice to government, funding decisions and the provision of research has been allocated to separate bodies. And scientific merit has been replaced by relevance to national needs as the main criterion for selecting projects to be supported. In 1992, as part of this trend, Simon Upton, the Minister of Research, Science and Technology, abolished the government's Department of Scientific and Industrial Research, replacing it with ten sector-based and commercially oriented Crown Research Institutes (CRIs).

The government justified these changes on the grounds that research performance needed to be more focused in a small country. Claiming last year that the changes have been a success, Upton produced a plan for the next 15 years, which aims to lift government expenditure to 0.8 per cent of gross domestic product.

In particular, Upton has reversed the downward trend of government funding through the new Marsden Fund (NZ\$25 million by next year) for merit-based ‘blue skies’ research outside the government's

priority-setting process and promised that the Public Good Science Fund, which supports projects in CRIs and universities, will be increased and its short-term grants extended.

But many scientists have been disillusioned by the impact of a 30 per cent decline in government funding since 1981. The NZAS has described this decline as “disastrous”. A survey of the 300 members of the association in the academic community, government and industry found that the scientific workforce had been “traumatized and decimated” and its productivity “greatly reduced”.

According to three past and present officials of the association, writing in the September issue of *NZ Science Review*, the CRIs have had “varying success, with some functioning well, but others experiencing difficulties, and one small CRI collapsed”. Even the effect of the Marsden Fund in sustaining basic knowledge is uncertain, they write.

Despite recent improvements, the survey concludes that morale among scientists is low. “Particularly those in the CRIs were unhappy about their management, which was viewed to be hierarchical, authoritarian, short-term focused and secretive.” Job security, it says, has been lost, salaries have declined, time spent on research has decreased, international regard has fallen, and freedom to publish and speak out on policy issues has been restricted.

The governing, conservative National Party has dropped sharply in the opinion polls to 35 per cent. In a recent lecture, Upton promised to boost environmental research through a ‘green package’ and called for a pause in “tinkering” further with science. Labour, led by Helen Clark, is closing on National with a popular promise to reduce student fees, but is vague about whether it will increase public spending on R&D, claiming it will be interventionist and will not leave investment to the market.

The left-wing Alliance, which promises to abolish student fees altogether, is polling level with NZ First, a party which has now been overtaken by Labour. Its leader, Winston Peters, a populist Maori defector from the Nationals, proposes to “increase public investment in science and technology to the median level of New Zealand's major trading partners” — although without saying where the money will come from.

In higher education, universities, polytechnics and associations of staff and students have joined in a Public Tertiary Education Coalition to oppose the funding cuts planned for the next three years by the National Party. **Peter Pockley**
