#### Abstract

The total syntheses of natural (+)-1893B (2) and three other diastereomers $\mathbf{1 4}, \mathbf{1 8}$, and 21 were accomplished. Starting from the sequential metathesis product 5 prepared in turn from a 7-oxanorbornene derivative ( + )-4, $\mathbf{2}$ was synthesized by means of an epoxyring opening of $\mathbf{9 a}$ with trimethylsilylacetylide followed by Wacker-type oxidation of the resulting alkyne $\mathbf{1 0}$ for the construction of the $\gamma$-lactone moiety. By applying the same synthetic sequence, three additional diastereomers of $\mathbf{2}, \mathbf{1 4}$, 18, and 21 were also synthesized. The biological activities of previously synthesized 1893A (1), 1893B (2), and the diastereomers of 1893B 14, 18, and 21 were investigated.

## Introduction

1893A (1) and 1893B (2) were isolated in 2003 during the course of antitumor natural products searching from a marine endophytic fungus designated as No. 1893, which exists in mangroves (Fig. 1) [1]. Lin and Chen reported that the extract mixture of No. 1893 appeared to exhibit cytotoxic and insecticidal activities. However, the biological activity of the pure metabolites $\mathbf{1}$ and $\mathbf{2}$ has not reported. The structure of $\mathbf{1}$ was elucidated by extensive spectroscopic studies and finally determined by X-ray

[^0]crystallographic analysis. As structurally related natural product, (+)-mycoepoxydiene (3) was isolated in 1999 $[2,3]$. We already reported the total syntheses of $\mathbf{1}$ and 3 , which were characterized by a sequential ring-opening/cross/ring-closing metathesis strategy [4, 5]. Although the stereostructures of $\mathbf{1}$ and $\mathbf{3}$ were confirmed by our synthetic studies, the stereochemistry of 2 was not unambiguously established at that time. Later, we were concerned with the stereochemically defined total synthesis of 2 through the total syntheses of all four possible stereoisomers regarding the vicinal diol moiety in 2 . The first total synthesis of natural (+)-2 was reported as a preliminary communication [6]. Herein, we describe in detail the total syntheses of $\mathbf{2}$ and three additional diastereomers. The evaluation of their biological activities is also presented.

## Results and Discussion

According to our previous report [5], we converted the enantioenriched 7-oxanorbornene derivative (+)-4 ( $>95 \%$ ee) into the cyclooctadiene 5 through a one-pot ring-expansion metathesis strategy (Scheme 1). The

primary alcohol in this cascade metathesis product 5 was oxidized to an aldehyde, which was then reacted with vinylmagnesium bromide, affording diastereomeric allylic alcohols 6a and 6b as an inseparable 1:1 mixture. To establish the stereochemistry of the diatereomers $\mathbf{6 a}$ and $\mathbf{6 b}$, the mixture was esterified with ( S )- $O$-acetylmandelic acid. The resulting two mandelic esters were cleanly separated by chromatography on silica-gel. After removal of the mandeloyl group from each ester, diastereomerically pure 6a and 6b were obtained. The newly introduced stereocenter of $\mathrm{C}-1$ in $\mathbf{6 b}$ was determined as depicted using the $\Delta \delta$ values of the $(S)$ - and $(R)$-mandelic esters derived from $\mathbf{6 b}$ in their ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra [7]. The stereochemically defined allylic alcohol $\mathbf{6 a}$ was subjected to the Sharpless $\mathrm{VO}(\mathrm{acac})_{2}$-catalyzed epoxidation [8], affording epoxy alcohols 7 as a $2: 1$ diastereomeric mixture. We deduced from the Sharpless empirical rule that the major isomer was anti-epoxy alcohol unsuitable for the synthesis of $\mathbf{2}$. Thus the Mitsunobu inversion of the diastereomeric mixture 7 was carried out using $p$ nitrobenzoic acid [9]. As expected, the anti:syn ratio turned from $2: 1$ to $1: 2$. The resulting $p$-nitrobenzoates were hydrolyzed to epoxy alcohols $\mathbf{8}$ as the syn-enriched form. After protection of the hydroxyl groups, syn- and anti-epoxy MOM ethers $\mathbf{9 a}$ and $\mathbf{9 b}$ were cleanly separated. The stereochemistry at $\mathrm{C}-2$ of $\mathbf{9 b}$ was unambiguously established based on the ${ }^{1} \mathrm{H}$ NMR difference $(\Delta \delta)$ of the corresponding ( $S$ )- and ( $R$ )- $O$-acetylmandeloyl esters prepared from 9b by regioselective hydride opening of the epoxy ring followed by esterification [7]. The opening of the epoxy ring of $9 \mathbf{9}$ with a two-carbon nucleophile was
investigated. After several attempts, we found that lithium trimethylsilylacetylide efficiently provided the desired product 10. For an introduction of the $\gamma$-lactone part, $\mathbf{1 0}$ was subjected to a Wacker-oxidation-like reaction using a palladium catalyst, providing the desired lactone 11. This oxidative cyclization was considered to proceed via regioselective trans-hydroxypalladations followed by [ $\mathrm{PdCl} / \mathrm{TMS}]$ syn-elimination [10]. After deprotection of 11 followed by acetylation, (+)-1893B (2) was obtained. The spectroscopic data (IR, ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}-\mathrm{NMR}, \mathrm{HRMS},[\alpha]_{\mathrm{D}}$ ) of synthetic 2 were identical with those reported for natural $(+)-1893 B$ in all respects.

Furthermore, we synthesized three diastereomers of 2, i.e., 14, 18 and 21, from the stereochemically defined intermediates $\mathbf{6 a}$ (for $\mathbf{1 8}$ and 21) or $\mathbf{9 b}$ (for 14) via exactly the same synthetic routes used for the conversion of $\mathbf{6 a}$ to $\mathbf{2}$ (Scheme 2).

## Biological Activities of $\mathbf{1 8 9 3}$ Series

Finally, the biological activities of $(+)-1983$ A (1) and $(+)-1983 B(2)$ and the three stereoisomers 14, 18, and 21 were explored (Table 1). Compound $\mathbf{1}$ was found to exhibit weak cytotoxicity in vitro against human chronic myelogenous leukemia K562 and human hepatocellular carcinoma HepG2 cells. However, neither compounds 2, nor diastereomers $\mathbf{1 4}, \mathbf{1 8}$, and 21 showed either antibacterial activities against a variety of Gram-positive and Gramnegative bacteria and cytotoxicity against the two tumor cell lines.

## Experimental

Melting points are uncorrected. Specific rotations were measured in a 10 mm cell. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra were recorded at JEOL GSX-270 $(270 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}$ NMR spectra at JEOL GSX-270 $(68 \mathrm{~Hz})$. All spectra were recorded in $\mathrm{CDCl}_{3}$. High-resolution mass spectra were measured by JEOL JMS-GCMATE spectrometer. Thin-layer chromatography (TLC) was performed with a glass plate coated with Kieselgel $60 \mathrm{~F}_{254}$ (Merck). The crude reaction mixtures and extractive materials were purified by chromatography on silica gel Silica Gel 60 (Merck) or Wakogel C300 (Wako Pure Chemical Industries). Unless otherwise described, reactions were carried out at ambient temperature.

Combined organic extracts were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Commercially available solvents were dried (drying reagent in brackets) and distilled prior to use: $N, N$-dimethylformamide (DMF) [ $\left.\mathrm{CaH}_{2}\right], \mathrm{CH}_{2} \mathrm{Cl}_{2}\left[\mathrm{CaH}_{2}\right]$, benzene $\left[\mathrm{CaH}_{2}\right]$, and pyridine $[\mathrm{NaOH}]$.

## Preparation of Diastereomeric Mixture of Allylic Alcohols 6a and 6b

The following reaction was carried out under Ar. To a cooled $\left(0^{\circ} \mathrm{C}\right)$ stirred solution of crude aldehyde $(65.5 \mathrm{mg}$, $370 \mu \mathrm{~mol})$ in THF ( 1 ml ), prepared from enantioenriched 5 ( $>95 \%$ ee) by Dess-Martin oxidation according to the previous report [5], was added vinylmagnesium bromide $(1.0 \mathrm{M}$ solution in THF, $0.6 \mathrm{ml}, 0.6 \mathrm{mmol})$. After being stirred for 10 minutes at $0^{\circ} \mathrm{C}$, the solution was quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(1 \mathrm{ml})$, diluted with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(10 \mathrm{ml})$, and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{ml} \times 4)$. The combined extracts were dried and concentrated in vacuo. The residue was purified by column chromatography on silica gel (EtOAc/hexane, 1:4), providing $49.5 \mathrm{mg}(70 \%)$ of the inseparable mixture of $\mathbf{6 a}$ and $\mathbf{6 b}$ as a colorless oil.

## Separation of Allylic Alcohols 6a and 6b

To a cooled $\left(0^{\circ} \mathrm{C}\right)$ stirred solution of the mixture of 6a and 6b $(49.4 \mathrm{mg}, 257 \mu \mathrm{~mol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{ml})$ were added $(S)-(+)-O$-acetylmandelic acid ( $200 \mathrm{mg}, 1.03 \mathrm{mmol}$ ), $\mathrm{EDCI} \cdot \mathrm{HCl}(197 \mathrm{mg}, 1.03 \mathrm{mmol})$, and 4-DMAP $(12.6 \mathrm{mg}$, $103 \mu \mathrm{~mol})$. The mixture was stirred for 10 minutes at $0^{\circ} \mathrm{C}$, diluted with EtOAc $(10 \mathrm{ml})$, and washed with 1 M aqueous $\mathrm{HCl}(5 \mathrm{ml} \times 3)$, saturated aqueous $\mathrm{NaHCO}_{3}$ $(5 \mathrm{ml} \times 3)$, then $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{ml})$. The organic layer was dried and concentrated in vacuo. The residue was purified by column
chromatography on silica gel (EtOAc/toluene, $1: 80$ ) to provide $47.0 \mathrm{mg}(53 \%)$ of ( $1 R$ )-ester derived from $\mathbf{6 b}$ and 36.3 mg ( $41 \%$ ) of ( $1 S$ )-ester derived from $\mathbf{6 a}$. ## Mitsunobu Inversion of the Diastereomeric Mixture 7. Preparation of the 1:2 Mixture of anti- and syn-Epoxyalcolols 8

To a cooled $\left(0^{\circ} \mathrm{C}\right)$ stirred solution of the inseparable mixture of epoxy-alcohols $7(7.9 \mathrm{mg}, 38 \mu \mathrm{~mol}), \mathrm{PPh}_{3}$ ( $40.0 \mathrm{mg}, 152 \mu \mathrm{~mol}$ ), and 4-nitrobenzoic acid ( 25.9 mg , $155 \mu \mathrm{~mol})$ in THF $(1.0 \mathrm{ml})$ was added dropwise diethyl azodicarboxylate ( $73 \mu \mathrm{l}, 0.16 \mathrm{mmol}$ ). After being stirred for 5 hours, the solution was diluted with 1 M aqueous HCl $(5 \mathrm{ml})$ and extracted with EtOAc $(3 \times 10 \mathrm{ml})$. The combined extracts were dried and concentrated in vacuo. The residue was purified by column chromatography on silica gel ( $\mathrm{EtOAc} /$ hexane, $1: 5$ ) to provide 18.6 mg of mixture of the 4-nitrobenzoate esters.

To a cooled $\left(0^{\circ} \mathrm{C}\right)$ stirred solution of thus obtained mixture $(18.6 \mathrm{mg})$ in $\mathrm{H}_{2} \mathrm{O} / \mathrm{MeOH}$, $(1: 1, \mathrm{v} / \mathrm{v}, 1 \mathrm{ml})$ was added $\mathrm{LiOH} \cdot \mathrm{H}_{2} \mathrm{O}(7.9 \mathrm{mg}, 0.19 \mathrm{mmol})$. This was stirred for 4 hours, diluted with saturated brine $(10 \mathrm{ml})$, and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{ml} \times 3)$. The combined extracts were dried
and concentrated in vacuo.
