

An implant with no compromise in quality or service

Most implant systems are very similar these days and all have a reasonable range of restorative components etc, so why should an implantologist choose Adin?

Adin implants enable implantologists to use an excellent implant system which offers dramatic savings on costs compared with other implant systems, but, in addition to this, Trycare provide an extremely quick and reliable, free standard next day delivery service backed up by knowledgeable and experienced staff. The unparalleled level of support provided by Trycare is a major reason why Adin customers remain so loyal.

Adin Implants

Adin implants have a double cutting thread on each apical blade and wide apical blades which collect the bone. Most other implants have no cutting threads on the implant or only one cutting thread.

The Adin active screw thread spiral tapered implant design is self-tapping which creates a tight friction fit between the threads, so that it fits closer to the bone for greater primary stability. It also compacts the bone around it during insertion, which further increases the primary stability of the implant substantially on placement, even in type 4 (soft spongy cancellous) bone, greatly

increasing the probability for short and long-term success.

In addition, the wide thread design of Adin implants increases the surface area of the implant and allows for more blood to reach the surface of the implant on placement. This has been shown to increase the amount of bone in contact (BIC) with the implant, which increases the stability of the implant offering more chance of long-term success.

The active thread design enables Adin implants to be fully inserted in just a few turns compared to other implant designs. In addition, the implant can be withdrawn and redirected to attain optimal positioning, if required, whilst still maintaining excellent primary stability due to the bone compacting effect of the implant's thread design.

The high primary stability of Adin implants after placement means they are ideal for immediate loading. Adin offer two types of implants within their range – Touareg S and Closefit. Both can be placed at bone level or subcrestal for maximum flexibility.

Benefits

Touareg S are undoubtedly their most popular implants and offer customers the opportunity of a simple switch from their existing implant system with no change to their surgical technique.

They are available in 3.5, 3.75, 4.2, 5.0 & 6.0mm diameters.

The full range of restorative components for Touareg S implants – from healing abutments, impression transfer copings, through to final restorative abutments – fit all five diameters of Touareg S implants. Likewise, one implant driver fits all the implant diameters and one restorative driver fits all the restorative components. This makes it a very simple system to use and easy to manage stock control of components.

The 2.42mm diameter standard internal hex connection on the Touareg S implant is a proven and reliably strong connection between implant and abutment. The SLA (Sandblasted, Large grit, Acid-etched) surface treatment on Touareg S implants is tried and tested and has been used by many other implant systems for many years. The surface is blasted with aluminium oxide particles and acid etched. This increases the surface area of the implant and therefore allows more possibility of bone in contact to increase the stability of the implant.

Touareg S implants have built-in platform switching ability enabling smaller diameter abutments to be placed on larger diameter implants. Touareg S is a very simple and easy to use implant system with a large choice of restorative components which fit any diameter implant, enabling the surgeon to restore an implant with many different options open to them.

Implants are just £99.00 plus vat each for mounted or unmounted versions, which makes them exceptional value for money.

How do Adin Touareg S implants compare with the other popular systems on the market?

Adin have a very versatile implant range that offers the same features and benefits as the other major implant systems, but at a better price. They also offer guided placement, a complete digital workflow, custom abutments, you can use Atlantis abutments and do same-day teeth.

So, with Adin you can do it all!
